

Consumer Price Index ♦ October 2009

Consumer Price Index (2002=100)

Highlights

- British Columbia's Consumer Price Index (CPI) fell 0.6% from October 2008, the fifth consecutive month of declines. Prince Edward Island had largest year-over-year drop (-0.8%), while New Brunswick and Quebec shared the highest inflation (+0.5%) compared to last October. Nationally, prices rose 0.1% from a year ago, after four months of declines.
- Among the metropolitan areas, Saint John had highest year-over-year increase in consumer prices (+0.8%), while residents in Charlottetown (-0.7%) experienced the largest decline. Prices fell in both Vancouver (-0.6%) and Victoria (-0.5%) from a year ago.
- Declining energy prices (-11.3%) continue to put downward pressure on BC's Transportation (-4.1%) and Shelter (-3.2%) components. Compared to a year ago, consumers also paid less for owned accommodation (-4.2%). Food prices rose (+1.9%), with increased prices for fish & other seafood (+9.3%) and non-alcoholic beverages (+6.3%) offset by lower prices for fresh vegetables (-3.7%) and fresh fruit (-2.6%). Other notable price increases were seen for reading material (+8.6%), local & commuter public transportation (+3.5%) and alcohol & tobacco products (+2.7%).
- BC's All-Items CPI excluding energy rose 0.4% from October 2008. The comparable figure for Canada was 1.4%.

Note: Statistics Canada will release the November Consumer Price Index on December 17, 2009.

Consumer Price Index—Terms and Definitions

Base Effect

The 12-month variation in the CPI is calculated by comparing the current month's index with the index for the same month of the previous year. The 12-month change is represented by the difference in the indexes of the reference months. Thus, the 12-month variation can decrease from one month to the next merely because the base serving as the point of comparison increased.

Source: Statistics Canada

Twelve-Month Percent Changes

Also referred to as "year-over-year", twelve-month percent changes compare indexes for a given month to indexes for the same month of the previous year. As they compare two points in time, they are influenced by unusual or temporary events that can affect either of the two months. Their calculation does not include any of the intervening monthly indexes.

Source: Statistics Canada

Annual Average Index

Annual average indexes are calculated by averaging index levels over the 12 months of

the calendar year. These data should not be confused with the 12-month change in the CPI. By the nature of the calculation, averaging indexes over the calendar year gives a better representation of price behaviour over the whole year and is closer to the concept of an average price. The use of annual averages is considered the preferred option for indexation purposes.

Source: Statistics Canada

Latest Twelve-Month Average Index

The latest twelve-month average index (ending in the current month) is a 12-month moving average of the indexes of the most recent 12 months. It is calculated like the annual average index. Hence, in theory, the December twelve-month average index would be equal to the annual average index for the calendar year. However, in practice, when BC Stats makes these calculations from published data, the December 12-month average index may differ from Statistics Canada's published annual average index due to rounding.
